COMMENTS: Odense has a moderate version of the mid-latitude four-season year. Precipitation is light, but is adequate in all seasons. It reaches a peak in August and is at its least in February. Humidities are high all year around, particularly at night. Morning dews and hoarfrosts are common, as are fogs and mists. In the summer, these usually burn off by noon; but in winter they may persist all day. Summers are short, with very long days, moderately sunny skies, mild to warm days (rarely hot), and cool to chilly nights. Winters are long, with very short days, cloudy skies, chilly to cold days and cold to very cold nights. Winter precipitation is about evenly split between rain and snow, so snow rarely remains on the ground for long. From November through February, half or more of the days pass with no direct sunshine at all. In December, three days out of four will be overcast to this degree. In summer, by contrast, only about one day a month is this cloudy.
