COMMENTS: The region has a four-season year. Precipitation is light, and is well distributed throughout the year. It hits a maximum in June, and a minimum in February. Summer afternoons are sunny, moderately humid, and hot--occasionally very hot. Summer nights are mild to cool. Winter afternoons are cloudy, damp, and cold. Two-thirds of the winter mornings start out below freezing, and one afternoon in four will fail to rise above that point. Snowfalls and snow flurries are characteristic of the winter season, but winter rains are common as well. These rains plus the frequent thaws keep the ground bare most of the winter. Even January, the snowiest month, will have snow on the ground on less than half the days. Spring and autumn are seasons of transition, when spells of warmer and cooler weather succeed one another as the various frontal systems move across Europe.
